

Input:

- Students Details
- It will accept only unique Roll No

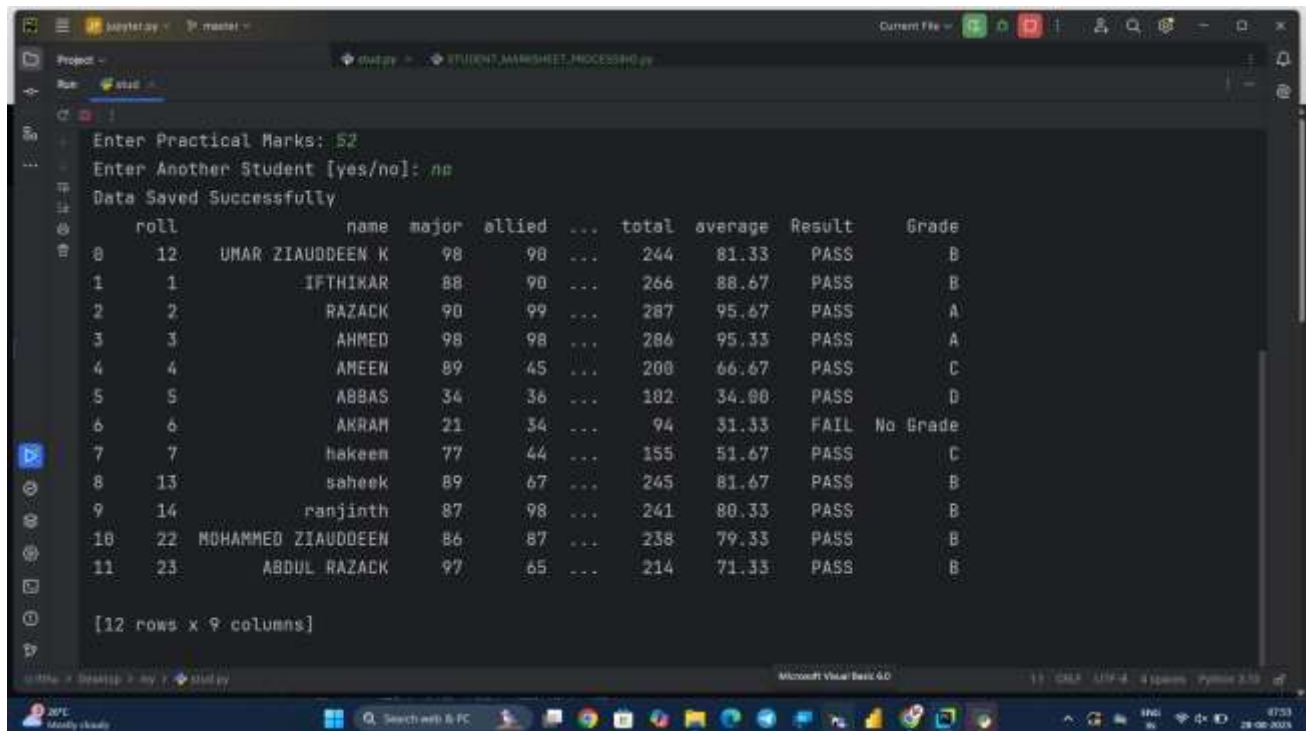

The screenshot shows a terminal window with a dark background. The command prompt is `C:\Users\ifthu\AppData\Local\Microsoft\WindowsApps\python3.12.exe C:\Users\ifthu\Desktop\my\stud.py`. The script prompts the user for student details. The first student's roll number is 1, which is already in the system, so the user enters 22. The second student's name is MOHAMMED ZIAUDEEN, Major Marks are 86, Allied Marks are 87, and Practical Marks are 85. The user then enters 'yes' to add another student. The third student's roll number is 23, name is ABDUL RAZACK, Major Marks are 97, Allied Marks are 65, and Practical Marks are 52. The user then enters 'no' to stop adding students.

```
C:\Users\ifthu\AppData\Local\Microsoft\WindowsApps\python3.12.exe C:\Users\ifthu\Desktop\my\stud.py
Enter your Roll no: 1
Roll number 1 already exists. Please enter a different one.
Enter your Roll no: 22
Enter your name: MOHAMMED ZIAUDEEN
Enter Major Marks: 86
Enter Allied Marks: 87
Enter Practical Marks: 85
Enter Another Student [yes/no]: yes
Enter your Roll no: 23
Enter your name: ABDUL RAZACK
Enter Major Marks: 97
Enter Allied Marks: 65
Enter Practical Marks: 52
Enter Another Student [yes/no]: |
```

Output:

- Displaying output using pandas with DataFrame in the Terminal

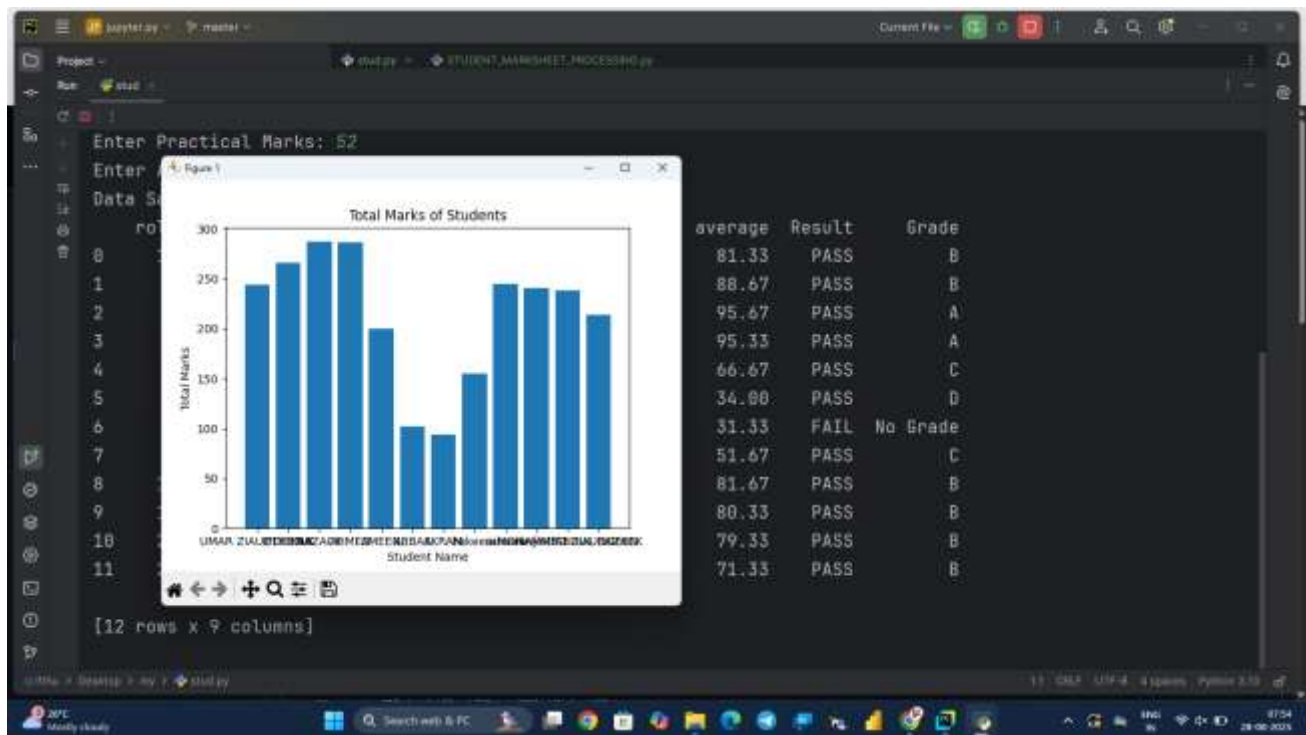

The screenshot shows a Jupyter Notebook interface with a terminal window displaying the output of a Python script. The script has prompted for practical marks and whether to add another student. The output shows the data saved successfully as a pandas DataFrame with 12 rows and 9 columns. The DataFrame contains student information including roll number, name, major, allied, total, average, result, and grade.

```
Enter Practical Marks: 52
Enter Another Student [yes/no]: no
Data Saved Successfully
```

	roll	name	major	allied	...	total	average	Result	Grade
0	12	UMAR ZIAUDDOEN K	98	98	...	244	81.33	PASS	B
1	1	IFTHIMAR	88	90	...	266	88.67	PASS	B
2	2	RAZACK	90	99	...	287	95.67	PASS	A
